

User Journeys (KRYSTAL)

Here, we describe the user journeys for the three main personas, illustrating their experience on the platform from registration to completing a key objective.

1. User Journey: The Model (Sofía Rodríguez)

Objective: Secure her first modeling job through KRYSTAL.

1. Discovery: Sofía hears about KRYSTAL and how the platform uses AI to improve portfolios and find work.
2. Profile Creation: She signs up, uploads her photos and videos, and connects her Instagram account.
3. AI Optimization: The AI (CLIP) analyzes her portfolio and suggests which photos to feature, how to order them, and what metadata to add. KRYSTAL automatically displays her Instagram metrics.
4. Project Discovery: She receives personalized notifications for projects that match her style and metrics. KRYSTAL shows a high "match percentage," giving her confidence to apply.
5. Application and Hiring: She applies, the business contacts her via the integrated chat, and KRYSTAL facilitates the agreement and contract signing.
6. Completion: She completes the job, gets paid, and the business leaves a review. Her profile is automatically updated with this new project, increasing her visibility.

2. User Journey: The Influencer (David Vargas)

Objective: Get a branded content collaboration with a tech brand.

1. Discovery: David is looking for a way to professionalize his influencer career and finds KRYSTAL, which promises an automatic "media kit."
2. Profile Creation: He signs up and connects his YouTube and Instagram profiles.

3. Metrics Visualization: KRYSTAL instantly generates a dashboard with his social media metrics (followers, engagement, reach, demographics), which are updated in real-time.
4. Content Recommendation: The AI (GPT-4) analyzes his content and gives him improvement suggestions for his branding.
5. Matching and Application: The system presents him with a project from a tech brand that is looking for influencers in his niche. KRYSTAL shows why his audience is a perfect fit for the campaign.
6. Negotiation and Contract: David uses the platform to negotiate terms and sign the contract. The platform manages project milestones and payment.
7. Completion: He completes the job, the business approves the content, and he gets paid securely. The project is added to his dynamic portfolio.

3. User Journey: The Business (Marcos González)

Objective: Create an advertising campaign and find a model and an influencer for the project.

1. Discovery: Marcos, frustrated with the manual talent search, finds KRYSTAL and its AI-driven project ideation feature.
2. AI Project Generation: Marcos describes his initial idea for a new product. The AI (GPT-4) presents him with 3 detailed and creative campaign project options, suggesting improvements and different approaches.
3. Refining the Project: He selects one of the options and edits it to add more details. The AI adjusts the project description in real-time to optimize the talent search.
4. Semantic Search: With the project finalized, the AI (text-embedding-ada-002) searches the talent database and presents him with a list of 5 models and 5 influencers who are the best semantic fit. Each profile includes a "Match Score."
5. Candidate Analysis: He reviews the profiles, viewing the models' portfolios (analyzed with CLIP) and the influencers' social media metrics. He can filter by location, rates, etc.
6. Selection and Hiring: He chooses Sofia (model) and David (influencer).

KRYSTAL allows him to contact both and manage communication and contracts in a single place.

7. Management and Completion: The platform becomes the control center for the project, managing communication, payments, and the final work delivery from both talents. Marcos leaves reviews, and the project is archived in his history.
